Exercise 20 – Create Business Parameters

Objective

By the end of this exercise, you will be able to create Business Parameters in the Library that can be later used in TestCases.

Why is this important?

Business Parameters allow you to create Reusable TestStepBlocks with changeable values.

Instructions

1. Duplicate the TestCaseFolder "Exercise 19 - TCP "; rename it to "Exercise 20 - Business Parameters".

2. In the Library, navigate to the Folder "Precondition" and add three Business Parameters:
   - URL
   - Email
   - Password

3. Drag each Business Parameter and drop it onto the relevant TestStepValue field to create a {PL} link.

4. Navigate to **Exercise 20 - Business Parameters**>>**Discount Code**>>**Precondition_Reference**>>**Business Parameters**.

5. Enter the correct value for each Business Parameter.

Business Parameter	Value
URL	http://demowebshop.tricentis.com
Email	Registered email address
Password	Registered password

6. Run the TestCase in the **Scratchbook**.

7. Set the TestCase WorkState to **COMPLETED**.

Hints

» Business Parameters will have been applied to all TestCases that used the Reusable TestStepBlock "Precondition".

Cheat Sheet

Term	Description	Example
Business Parameters	Business Parameters allow you to modify values in the Reusable TestStepBlocks References without changing the Reusable TestStepBlocks in the Library. They are the business-relevant elements of your TestSteps whose values you want to steer in your TestCase.	For example, we want the input data for URL, Email, and Password to change, depending on which TestCase we run. Therefore, we create Business Parameters for each of these.
